Types of Blood Cells

- **Red Blood Cells (Erythrocytes):** Responsible for oxygen transport from lungs to tissues and carbon dioxide removal.
- **White Blood Cells (Leukocytes):** Play a key role in the immune response, fighting infections and foreign substances.
- **Platelets (Thrombocytes):** Aid in blood clotting and wound healing.

Importance of Blood Cell Counts

Blood cell counts help diagnose various health conditions, including anemia, infections, immune disorders, and blood cancers. Laboratory reports provide counts and percentages that aid clinicians in making informed decisions.

Key Components of Laboratory Report 38 Blood Cells Answers

Understanding the typical answers and their implications provides clarity on interpreting blood test results.

Red Blood Cell (RBC) Count and Hematocrit

- **Normal RBC Count:** Usually ranges between 4.7-6.1 million cells per microliter for men and 4.2-5.4 million for women.
- **Hematocrit:** Percentage of blood volume occupied by RBCs; normal values are approximately 40-54% for men and 37-47% for women.
- **Implications of Abnormal Results:** Low RBC or hematocrit indicates anemia; high values may suggest dehydration or polycythemia vera.

White Blood Cell (WBC) Count and Differential
